

UNIVERSITY OF ESWATINI

FACULTY OF SCIENCE AND ENGINEERING

DEPARTMENT OF COMPUTER SCIENCE

Software Designer

Module: CSC392

Name: Gcinwayinkhosi Bhembé

Student ID: 202405187

1. Role Description

As a Software Designer in our group, my role was to help plan how the system would work before it is built. I worked with another designer to make sure the system makes sense, is easy to use, and meets the needs of the project.

My job was mainly to take the idea we had and turn it into a clear plan that shows how everything connects and works together.

2. Responsibilities

Planning how the system will work step by step

Thinking about how users will interact with the system

Identifying the main parts of the system (like the scanner, server, and database)

Helping design how information will be stored

Making sure the system is simple, secure, and efficient

Working with other group members to make sure everyone is on the same page

3. My Contribution

I helped design how the system works when a student scans their card. When the card is scanned, the system reads the card details, checks them in the database, and then decides whether to allow access or not. This helps make sure only the right students can enter the residential blocks.

I also helped think about the user side of things. The system needs to be quick and easy to use, so students don't struggle when entering. For example, the system should clearly show whether access is allowed or denied.

I also contributed to planning how the data will be stored, like student information, card numbers, and records of who enters and when. This is important for tracking and security.

4. Teamwork

I worked closely with Nsika (the other software designer) to share ideas and improve the design. We discussed different approaches and agreed on the best way to structure the system.

I also communicated with other group members to make sure the design matches what they are working on. This helped keep the project organized and made it easier for everyone to understand how the system should work

5. Conclusion

My role as a Software Designer helped give the project a clear direction. By planning how the system works and how users will interact with it, I helped create a strong foundation for the rest of the team to build on.
